

# The KeYmaera X Theorem Prover for Hybrid Systems Logical Systems Lab, Carnegie Mellon University

#### Abstract

KeYmaera X is a theorem prover for specifying and verifying correctness properties of *hybrid systems* (systems that mix discrete and continuous dynamics). KeYmaera X implements *differential dynamic logic*  $(d\mathcal{L})$  and provides a high degree of control over automated proof search.

#### **Architectural Overview**

KeYmaera X features a minimal core that isolates soundness-critical axiomatic reasoning. Tactics built on top of this core drive automated proof search, and a modern web-based front-end provides a clean interface for both interactive and automated proving.

#### Core Features of KeYmaera X

(a) KeYmaera X provides a list of applicable tactics when a goal is selected.

| 🖃 Agenda  | Overview | Invariant Initially Valid  |
|---|----------|--|
| $( ightarrow r) rac{\Gamma, \phi dash \psi, \Delta}{\Gamma dash \phi  ightarrow \psi, \Delta}$   |          | <sup>-1</sup> $v^2 ≤ 2 · g() · (H - x) ∧ 0 ≤ x ∧ x ≤ H ∧ g() > 0 ∧ 0 ≤ H ∧ 0 ≤ c ∧ c < 0$  |
| $([\alpha^*] \operatorname{ind}) \frac{\Gamma \vdash \phi_! \Delta  \Gamma \vdash \forall^{\alpha} (\phi \to [\alpha] \phi)  \Gamma \vdash \forall^{\alpha} (\phi \to \psi)}{\Gamma \vdash [\alpha^*] \psi_! \Delta}$ |          | $1 \qquad \qquad$ |
| $( ightarrow r) rac{\Gamma,\phidash\psi,\Delta}{\Gammadash\phi\psi,\Delta}$  |          |  |
| $\left(  ightarrow r ight) rac{\Gamma,\phidash\psi,\Delta}{\Gammadash\phi ightarrow\psi,\Delta}$   |          |  |
|   |          |  |
| revious 1 Next  |          | Run Custom Tactic  |

(b) A list of previously executed tactics provides an overview of the proof history.

KeYmaera X supports both interactive and automated proof search for hybrid systems models. ► The web-based user interface (pictured above) supports interactive proving and exposes built-in general-purpose proof search tactics that suffice for many models. Domain or problem-specific proof search techniques are implemented using a tactic combinator library. An isolated soundness-critical core ensures that bugs in custom tactics cannot introduce unsoundness.

### **Tactical Theorem Proving for Hybrid Systems**

The following  $d\mathcal{L}$  formula describes a safety property for a car model.

$$\underbrace{v \ge 0 \land A > 0}_{precondition} \rightarrow [(\underbrace{a := A \cup a := 0}_{ctrl}; \underbrace{\{p' = v, v\}}_{plant}]$$

The general-purpose tactics shipped with KeYmaera X will discover a proof for this model automatically. An efficient tactic specialized to this problem can be implemented using the tactic combinator library:

```
ImplyRight & Loop("v>=0".asFormula) & onLabel(
  ("base⊔case", Master),
  ("induction_step", ImplyRight & Seq & Choice & AndRight &&
      (Assign & ODESolve & Master,
      Assign & ODESolve & Master) ),
  ("use⊔case", Master)
```

## Try KeYmaera X!

KeYmaera X is available for download at keymaerax.org

User-written tactics may be applied to both entire problems and subproblems.

 $= a \})$ postcondition
